

# Land Data Assimilation System Heritage

---

## North American LDAS

- NOAA/NCEP, GSFC/HSB, and 6 other institutions
- Central North American domain,  $1/8^\circ$  resolution
- Spin-offs: GLDAS, NLDAS-E
- Ref: Mitchell et al., *J. Geophys. Res.*, 2004

## Global LDAS

- NASA/IDS Project began in 2000; now supported by NASA/NEWS
- GSFC/HSB and NOAA/NCEP partnership
- Global domain ( $60^\circ\text{S}$ - $90^\circ\text{N}$ ),  $1/4^\circ$  and  $1^\circ$  resolutions
- Spin-offs: LIS, South American LDAS
- Ref: Rodell et al., *Bull. Amer. Meteor. Soc.*, 2004

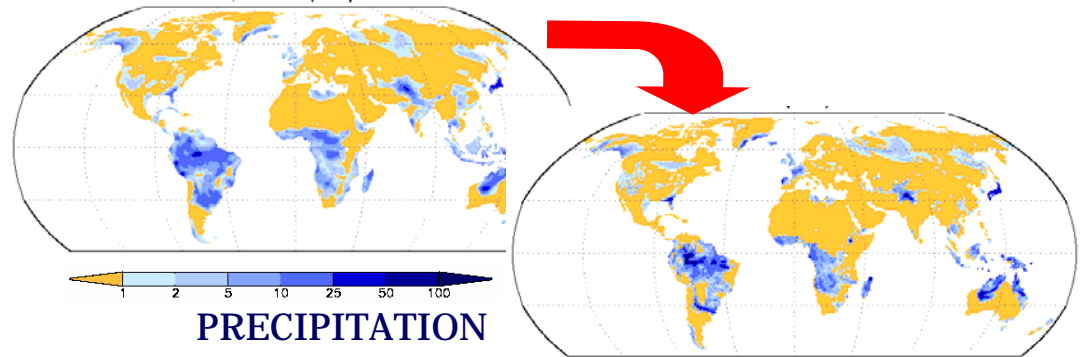

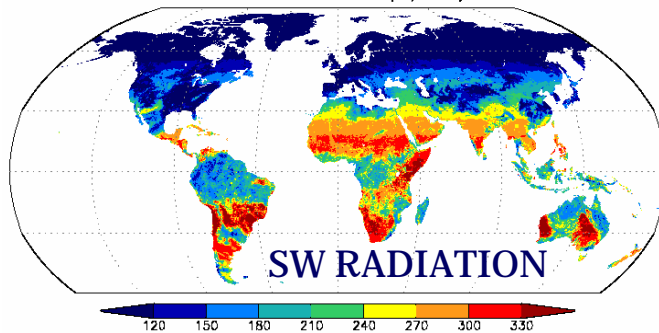

## Land Information System (LIS)

- NASA/HPCC project began in 2002; multiple partners
- Global domain ( $60^\circ\text{S}$ - $90^\circ\text{N}$ ), resolutions as fine as 1 km
- Software adopted by all other NASA LDAS projects
- Ref: Kumar, Peters-Lidard, et al., *Environ. Model. Soft.*, 2005

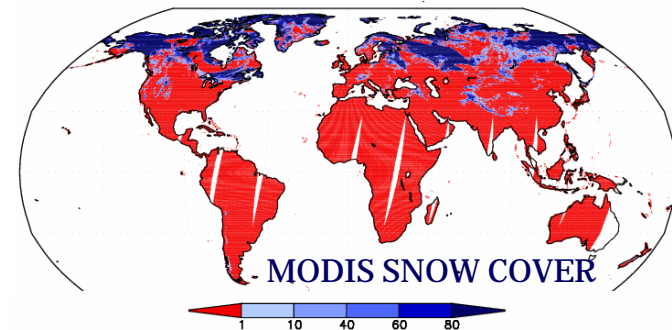

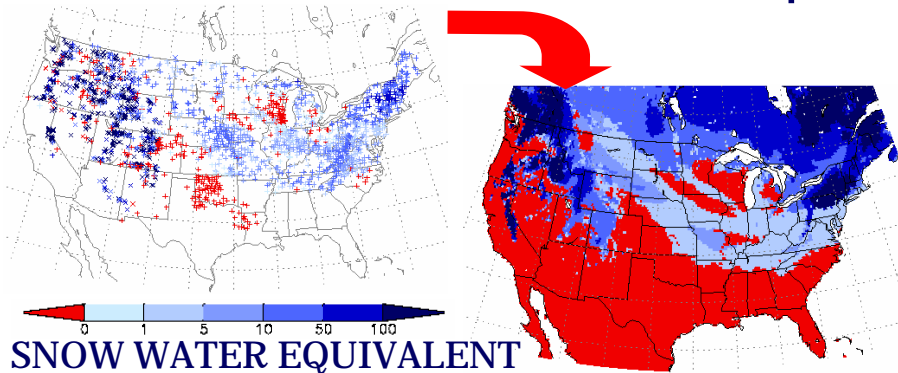

# Data Integration in GLDAS

INTERCOMPARISON and  
OPTIMAL MERGING of  
global data fields

Satellite data products used to  
PARAMETERIZE and FORCE  
sophisticated land surface models

ASSIMILATION of satellite based  
land surface state fields (snow,  
soil moisture, surface temp, etc.)

Ground-based observations  
used to EVALUATE model  
output

Paul R. Houser, NASA/GSFC Hydrological Sciences  
Paul.Houser@gsfc.nasa.gov

Parameters	U. Maryland and Boston U. vegetation – class/albedo/LAI, 1 km global GTOPO30 digital elevation model, 30" global Reynolds, Jackson, and Rawls [1999] soils, 5' global
Modeled Forcing	NOAA Global Data Assimilation System (GDAS), real time & forecast, ~0.7° NASA Goddard Earth Observing System (GEOS 3.24), near-real time, 1.0° g AFWA AGRMET surface analysis, near-real time, 48 km global ECMWF surface analysis, near-real time, T512
<i>Observation-based fields to replace modeled forcing fields</i>	SW & LW radiation derived from AFWA cloud analyses Precipitation derived from gage, satellite IR, TRMM & SSM/I microwave
Data for assimilation, calibration, and validation	Precipitation - GTS and merged products (e.g., CMAP) Surface temperature from several satellite platforms Soil moisture from AMSR, SMOS, and in-situ networks Snow depth/water from microwave Snow cover from satellite (e.g., MODIS), SNOTEL, GTS Total water storage changes from GRACE Streamflow from satellite altimeter, USGS

# Land *Data* Assimilation

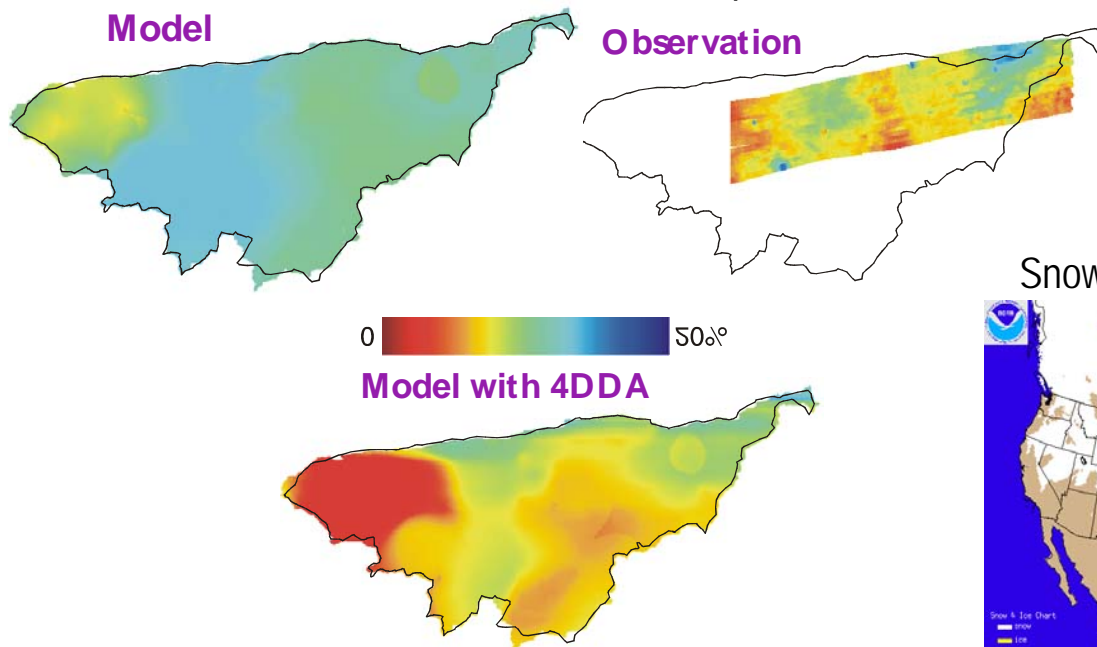

**Data Assimilation** merges observations & model predictions to provide a superior state estimate.

$$\frac{\partial x}{\partial t} = \text{dynamics} + \text{physics} + \Delta x$$

Remotely-sensed hydrologic **state** or storage observations (**temperature, snow, soil moisture**) are integrated into a hydrologic model to improve prediction, produce research-quality data sets, and to enhance understanding of complex hydrologic phenomenon.

## Data Assimilation Example

Soil Moisture

Snow Cover/Depth

Skin Temperature

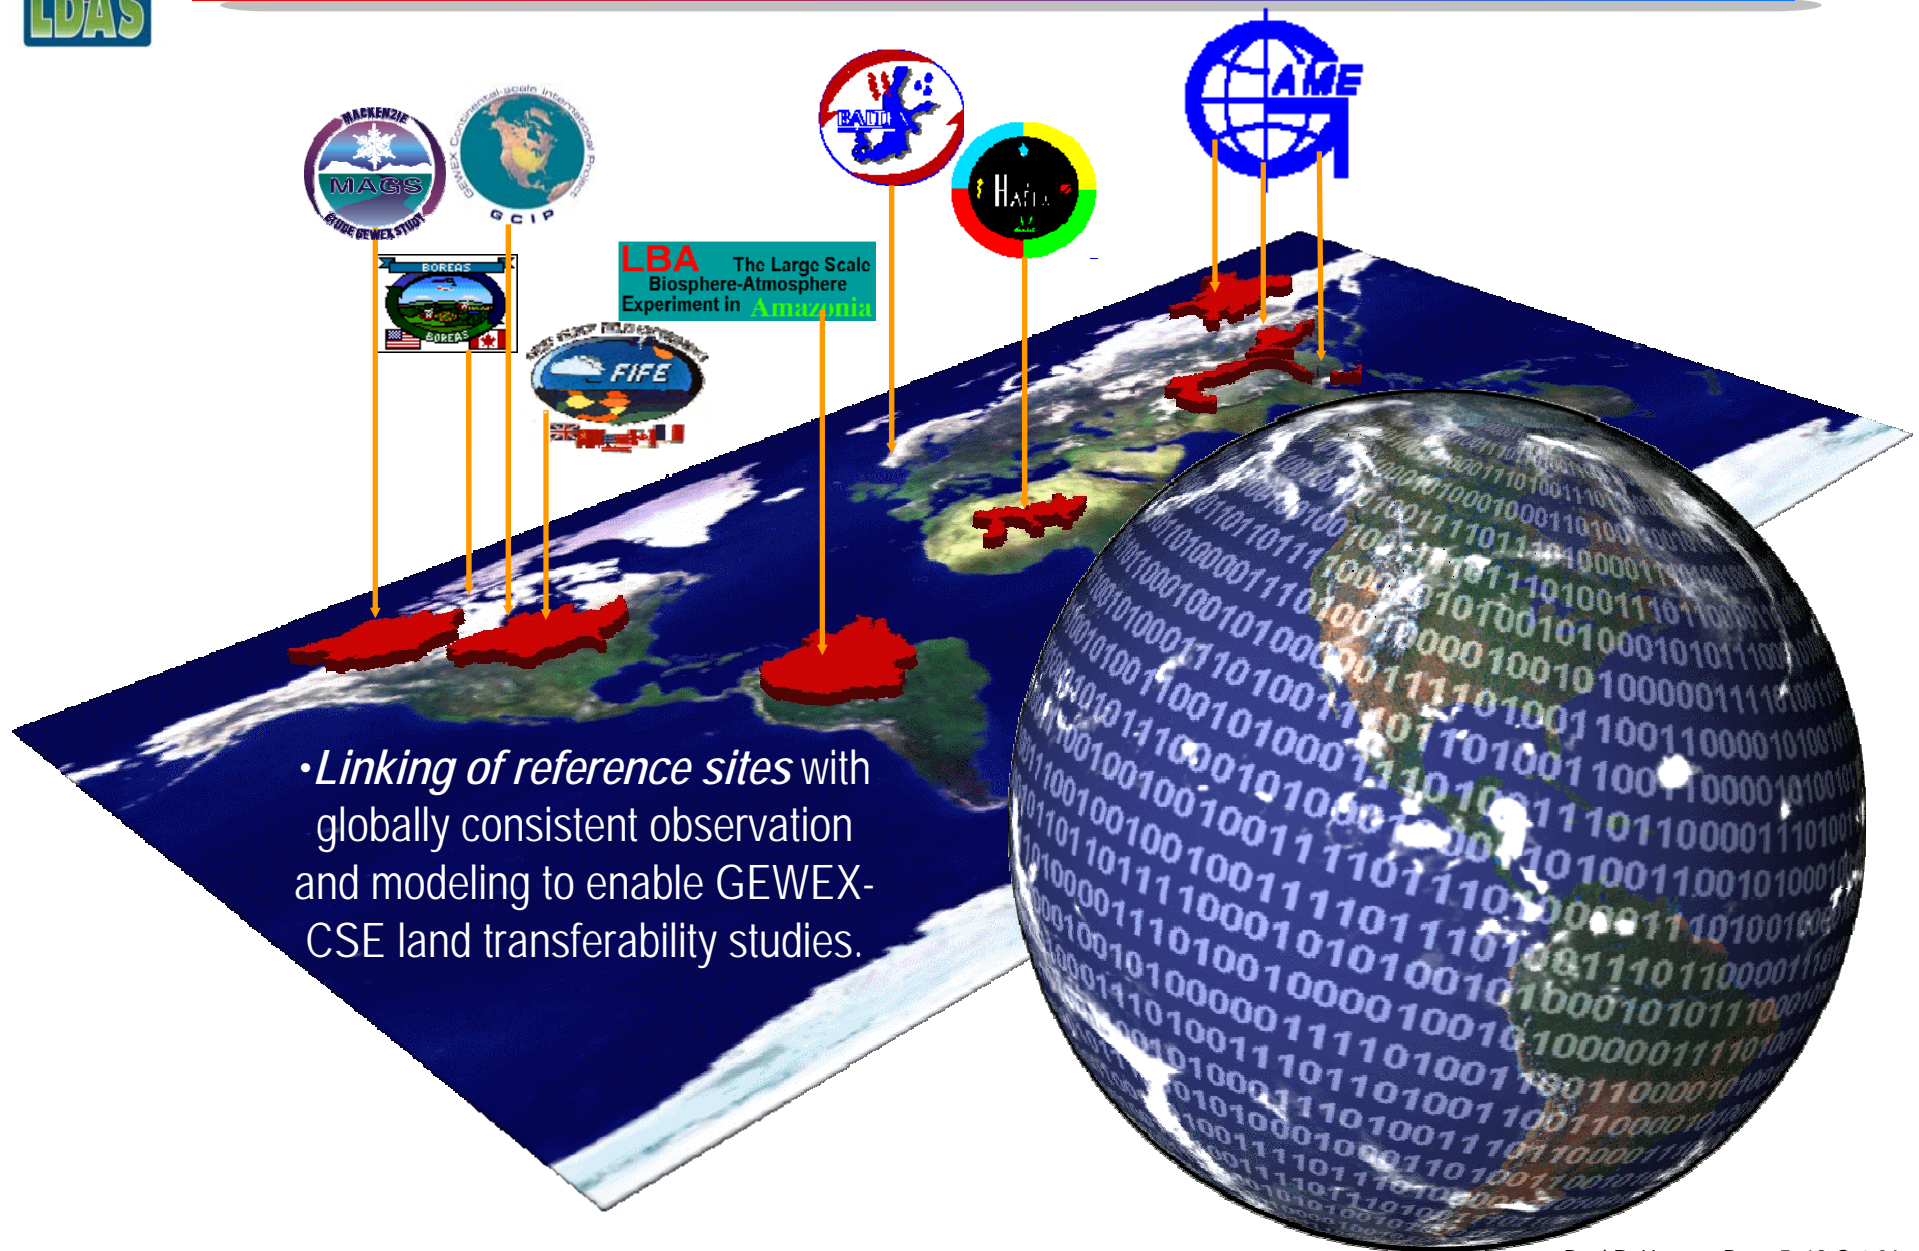

Skin temperature derived from NOAA/NESDIS GOES.

# GLDAS-CEOP Synergy

# Sensitivity of GLDAS/LIS LSMs to Physics, Land Characteristics, and Forcing

- Control simulations of LIS/Noah, CLM2, and Mosaic forced by CEOP site observations
- Best available global datasets used to test sensitivity of modeled states and fluxes to choice of LSM, precipitation and radiation forcing, elevation, soils, and vegetation
- Choice of LSM has largest impact
- In many cases, observed states and fluxes could not be reproduced no matter which inputs were chosen
- Results emphasize the importance of improving model physics and calibration

**Top: Sensitivity of simulated seasonal ET (mm/month) to 6 runtime options**

**Below: Likely potential ranges of simulated monthly ET (mm/month) compared with CEOP observations**

*From Kato, Rodell, et al.,  
J. Meteor. Soc. Japan, in  
revision, 2006.*

# Land Data Assimilation Systems: CEOP Synergy

*CEOP and GLDAS have value-added synergy:*

- **Compile** the land data (obs and analyses) including radiance, higher-level satellite, in-situ, and NWP/reanalysis land data.
- **Test and evaluate multiple land surface hydrologic models**
- **Long term** land model baseline experiments and intercomparisons
- **Linking of reference sites** with globally consistent observation and modeling to enable GEWEX-CSE land transferability studies.
- **Initialize land** surface states for seasonal-to-interannual coupled **predictions**.
- Use GLDAS to **evaluate** NWP and climate predictions for land.
- **Integrate remote sensing** land observations in land/atmospheric modeling for use in CEOP and higher level understanding.
- GLDAS may serve as a CEOP **data integration center**.
- Data assimilation and modeling may serve as a **quality control check** on observations.
- 4DDA “value-added” GLDAS-CEOP datasets
- GLDAS-MOLTS from multiple land surface models.
- Consistent GLDAS **reanalysis** for CEOP

*GLDAS views CEOP as an opportunity for increased community involvement and coordinated validation through data set development and continuity.*

***“LDAS” concept:***

Optimal integration of observation, simulation, and assimilation tools to operationally obtain high quality land surface conditions and fluxes continuous in time&space; multiple scales; retrospective, realtime, forecast
