

The Water and Energy Cycle

Water in the climate system functions on all time scales: From hours to centuries

The Energy and Water Cycles are <u>tightly</u> <u>intertwined</u> – Solar radiation drives and feedbacks with the water cycle, and energy is transferred through water movement and phase change.

Importance of global water and energy cycling

1. Water exists in all three phases in the climate system and the phase transitions are a significant factor in the regulation of the global and regional energy balances

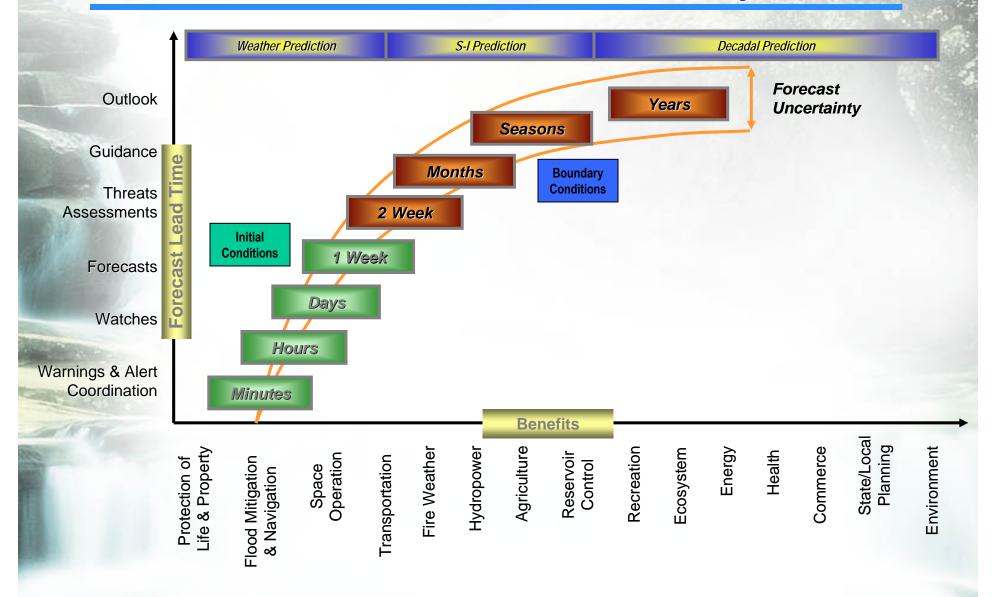

2. Water vapor in the atmosphere is the principal greenhouse gas and clouds at various levels and composition in the atmosphere represent both positive and negative feedback in climate system response

3. Water is the ultimate solvent and global biogeochemical and element cycles are mediated by the dynamics of the water cycle

4. Water is the element of the Earth system that most directly impacts and constraint human society and its well-being.

Seamless Suite of Forecasts to meet W&E cycle needs

Why study the water and energy cycle?...

Variations in greenhouse gases, aerosols, and solar activity force changes in climate...

...but, <u>consequences</u> of climate change are realized through the water cycle.

Thus, we must <u>characterize</u>, <u>understand</u>, and <u>predict</u> variations in the global water cycle.

Water and Energy is linked to all 12 Science Application Themes.

NASA WEC Observation Capabilities

NASA WEC Modeling & Prediction Capacities

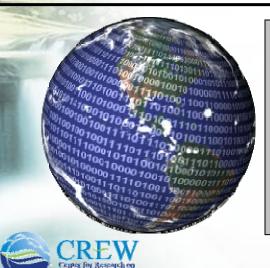

Climate models' grid-box representation of Earth's processes...

Each grid-box can only represent the "average" conditions of its area.

However, controlling processes of the water cycle (e.g. precipitation) vary over much smaller areas.

Developing Advanced Process-Resolving Models

- **■**Useful prediction is critical it is the link to stakeholders.
- ■We must move towards a new paradigm of climate models that produce useful weather-scale, process-scale, and application-scale prediction of local extremes (not just mean states).
- ■We must more fully constrain climate models with observations, to improve their realism and believability.

NASA Applied Science Challenge

Conduct research that addresses end-user needs, and nurture the transition of these research results into straightforward end-user solutions.

Information about environmental conditions are **critical for real-world applications**.

Users are **inundated with observations and model output** in disparate formats and locations.

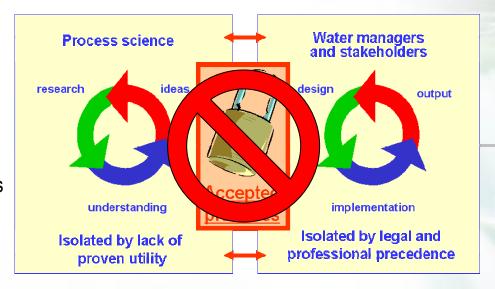

Science and technology has the potential to improve water management....
So, why doesn't research and technology advances always improve applications?

- → Inadequate *understanding* of end-user needs produces non-optimal science/technology investment.
- → Inadequate *technology* (lack of useful water resource research results (observations, models, etc.).
- → Inadequate *integration of information* (lack of informative predictions, or bottlenecks in software/hardware engineering).

Paradigm lock: (1) science lacks proven utility, (2) users isolated by professional precedence

So, what can we do about this?

- Define research priorities based on needs
- Observe key environmental factors
- Integrate information from diverse sensors
- Assess the current environmental conditions
- Predict future environmental possibilities
- Link to decision and operation support systems

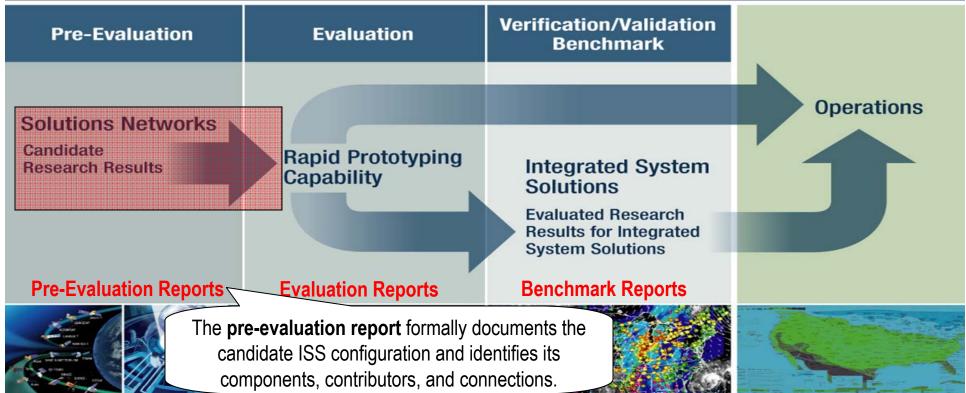

NASA Applied Science Approach

Solutions Networks harvest and explore research capabilities and support needs to identify candidate solutions. Thus, the role of *WaterNet* is to

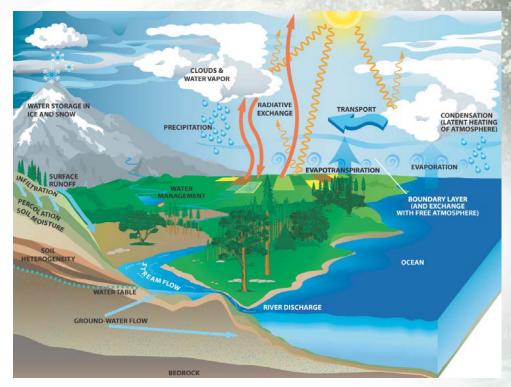

- 1. Harvest water-cycle research results and water-cycle relevant decision support needs.
- 2. Analyze this information to *identify candidate solutions*, and *determine the configuration required to build the solution (pre-evaluation report)*
- 3. Optimize the network to improve the fidelity of the candidate solutions.

Applied Sciences Systems Integration Engineering Environment

Project Motivation and Goal

- Earth is a unique, living planet due to the abundance and vigorous cycling of water.
- Water is essential to life and directly impacts society's welfare, progress and sustainable growth.
- It is a national priority to use advancements in scientific knowledge to develop solutions to water challenges.

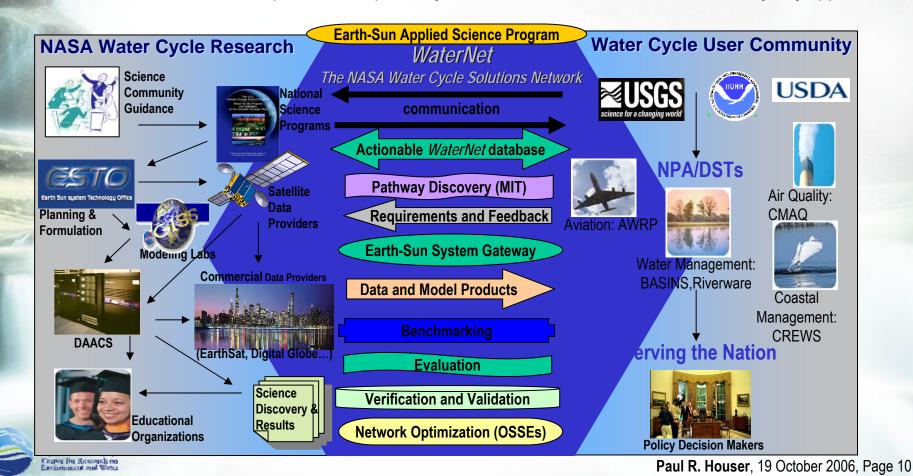

WaterNet GOAL: <u>improve</u> and optimize <u>the sustained ability</u> of water cycle researchers, stakeholders, organizations and networks to interact, identify, <u>harness</u>, and extend NASA <u>research results</u> to augment decision support tools and <u>meet national needs</u>.

WaterNet: Concept

Improve and optimize the sustained ability of water cycle researchers, stakeholders, organizations and networks to interact, identify, harness, and extend NASA research results to augment decision support tools.

- 1. Evolve a network of partners: identify and analyze partner organizations to define collaboration pathways.
- 2. Routinely identify, prioritize, mine and communicate relevant research products and results.
- 3. Optimize water cycle partner access to research results and products to create a self-sustaining network.
- 4. Analyze and document the network effectiveness through metrics, resource estimates and documentation.
- 5. Education and outreach is important to help society understand and use the research in every-day application.

OUTCOMES

Partners with Decision Support Tools

WaterNet: Work Plan

- 1. Evolve a network of water cycle partners: identify and analyze water cycle community-of-practice organizations, DSTs and their requirements and develop well-constructed teams and partnerships to define collaboration pathways.
- Routinely identify, prioritize, mine and communicate relevant NASA water cycle results that
 address NPAs, and develop operational information system pathways to provide timely user-community
 access.
- 3. Optimize water cycle partner access to NASA water cycle research, through developing prototypes, evaluation methods, verification procedures, and benchmarking standards to create an evolving and self-sustaining network.
 - Network Optimization
 - OSSEs: MIT Integrated Global System Model (IGSM)
 - **PROTOTYPES:** SAHRA/USBR Western Rivers Water Management; Coral Reef Early Warning System (CREWS); CUAHSI-Hydrologic Information System (HIS); State-of-the-Water-Cycle Demonstration; CNRFC-Water and Emergency Management Demonstration; NCAR's Research Applications Lab (RAL)
- 4. Analyze and document the WaterNet effectiveness by developing metrics, standards, resource estimates, documentation procedures, guidelines, and pre-evaluation reports to describe the steps to access and utilize NWRs
- 5. Engage in education and outreach to help society understand the water cycle and its potential application benefits.

A selection of water-cycle relevant DSTs and the potential value of NASA water cycle research

NPA	Water Cycle Relevance	Example DSTs	Value & Benefit to Citizens & Society
Agricultural Efficiency	Improved production and yield prediction through water availability, and improved weather, climate, and hazard prediction	Crop Assessment Data Retrieval and Evaluation PECAD/(CADRE) POC Brad Doorn	Reduction in production costs; Better seasonal yield estimates; Early warning of food shortages
Air Quality	Quantify atmospheric nitrogen deposition to water bodies as major contaminant Provide accurate precipitation data	Community Multiscale Air Quality Modeling System (CMAQ), POC: Kenneth L. Schere Air Quality Index (AQI); POC: Doreen Neil	Reduction of the following: lung-related diseases, premature death, hospital admissions, etc Improve crop resiliency/estimates; pollution reports
Aviation	Turbulence, oceanic convective weather, and ceiling/visibility, precipitation, icing	National Air Space Aviation Weather Research Program (NAS-AWRP) POC: Gloria Kulesa	Improved Safety, Improved Efficiency, Earlier warnings of hazardous weather, Reduction in the cost of flying
Carbon Mgmt	Provide accurate precipitation SM and ET for improved carbon flux estimates	Carbon Query and Evaluation Support Tools (CQUEST) POC: Dr. Christopher Potter	Improved efficiency in crop production, Climate change mitigation
Coastal Mgmt	Providing water availability and stresses on these systems Provide accurate precipitation, salinity, and runoff data Providing water availability and stresses	Coral Reef Early Warning System (CREWS) POC: Jim Hendee General NOAA Oil Modeling Environment (GNOME) POC: Gwen Jackson	Alerting to coral bleaching conditions in the Florida Keys and the Great Barrier Reef Understand & mitigate effects of oil and hazardous materials in waters and along coasts; Improve tourism
Disaster Mgmt	Prediction, assessment, and management of drought, wildfire, hurricane, climate, flooding hazards by providing precipitation, runoff, soil moisture and snow, data.	Advanced Weather System Interactive Warning System (AWIPS) POC: TBD Hazards U.S.(HAZUS), POC: Claire Drury	Disseminate warnings including flood/forecasts in rapid, highly reliable manner Identify/ Prioritize high-risk communities, Improve disaster response, Community planning
Ecological Forecasting	Biodiversity conservation and ecological sustainability, protected area management, and marine fisheries forecasting using soil moisture, precipitation and ET	Regional Visualization & Monitoring System (SERVIR) POC: Dan Irwin Terrestrial Observation & Prediction System (TOPS), POC: Ramakrishna Nemani	Predict the impacts of changing land-use patterns & climate on ecosystem Develop ecological forecasts. Enhance management decisions related to floods, droughts, human health, and agricultural production.
Energy Mgmt	Energy production and efficiency using accurate global solar radiation, precipitation, snow, soil moisture, runoff.	Renewable Energy Technologies Screen (RETScreen) POC: Gregory J. Lend Micropower Optimization Mode (HOMER)	Optimize renewable energy systems Finds cost effective methods of energy distribution
Homeland Security	Water supply info enabling response, recovery and mitigation to threats and military mobility prediction	Interagency Modeling and Atmospheric Assessment Center (IMAAC) POC: Stephen Ambrose Integrated Operations Facility (IOF), POC: TBD	Anticipate disaster-related damage, Improve response Improve disaster response; Reduction in lives lost; Reduction in damage cost and time to recover
Invasive Species	Primary factor controlling invasive species; is accurate precipitation data	Invasive Species Forecasting System (ISFS) POC: Michael T. Frame	Improvement in quality of health for man, animals and plants.
Public Health	Epidemiologic surveillance systems for infectious disease, environmental health, and public health preparedness directly aided by precipitation and soil moisture	Rapid Syndrome Validation Project (RSVP) Malaria Modeling and Surveillance (MMS) POC: Richard Kiang	Provide early warnings for harmful exposures, Reduce environmental related diseases Increase warning time; Reduce pesticide/drug resistance
Water Mgmt	Provide accurate precipitation , snow, soil moisture, ET, and runoff data for water management decision support	RiverWare, POC: T. Flup, D. Frevert, D. Matthews, M. Brilly, G. Gregoric; CALSIM: P. Fujitani, L. Peterson; HECRAS: D. Davis; WMS: J. Jorgeson Better Assessment Science Integrating Point & Nonpoint Sources(BASINS), POC: R. Kinseson	Forecasting and long-term water management planning, Water supply quantity and hydrologic runoff and floods Improved impaired surface waters, storm water management issues drinking water source protection; Improvement in monitoring of coast area water.

Selected water-cycle related science and stakeholder networks; to be engaged by the WaterNet

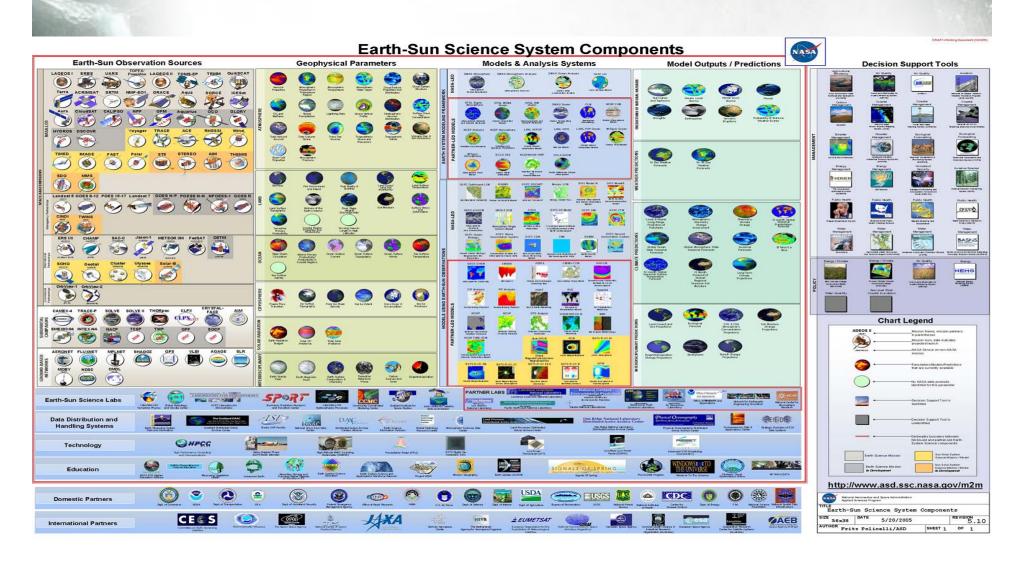

Network	Description	
CUAHSI	The Consortium of Universities for the Advancement of Hydrologic Science, Inc. (CUAHSI) is a corporation of 100 university member institutions founded in 2001 to develop and enable a research agenda for the hydrologic science community. CUAHSI's program calls for research to be carried out at much larger spatial scales than has been done in the past, to integrate all parts of the terrestrial hydrologic cycle in addressing research questions, and to link hydrologic, chemical, and biological processes. CUAHSI's program in Hydrologic Information Systems (HIS) will create comprehensive hydrologic data models consisting of an information database coupled with tools for acquiring, analyzing, visualizing, and modeling to distribute and synthesize hydrologic data.	
СВР	Columbia Basin Project is a multi-state MT, WA, ID, OR that involves a network of 175 irrigation districts, Grand Coulee Dam, and related storage facilities on the Columbia River and tributaries produce large quantities of hydropower, agricultural products, and manage the riverine ecosystems of this region. This project is managed by Reclamation in conjunction with the Bonneville Pondaministration, British Columbia Power, Canada, and state and local entities. DSTs are used in the operation and planning of water resources management in this area.	
CVP	Central Valley Project of California, operated by the California Department of Water Resources, Reclamation, US Army Corps of Engineers, and a network of irrigation and power companies. The Central Valley Operations Office uses a variety of DSTs for daily and monthly operational decision-making on the 150 reservoirs and hundreds of irrigation canals and laterals through out the Central Valley.	
URGOM	Upper Rio Grande Water Operations Model and network of users including the US ACE, USGS, Reclamation, and the irrigation districts and municipalities that use water from the Rio Grande Basin. This DST and user network provide water management solutions to this water scarce region which has headwaters in the San Jaun Mountains of Colorado and involves NM, TX, and Mexico, and the Colorado River Basin diversions.	
GMES	GMES is a joint initiative of the European Commission and the European Space Agency, designed to establish a European capacity for the provision and use of operational information for Global Monitoring of Environment and Security (GMES).	
PUB	The IAHS Decade on Predictions in Ungauged Basins (PUB) is aimed at formulating and implementing appropriate science programs to engage and energize the scientific community, in a coordinated manner, towards achieving major advances in the capacity to make predictions in ungauged basins.	
GWSP	The Global Water System Project (GWSP) will undertake key cross-cutting activities such as generating an information database on global water system change, facilitating a discourse on water between the social and natural sciences, and developing scenario models for the global water system.	
HELP	Hydrology for the Environment, Life and Policy (HELP) is designed to establish a global network of catchments to improve the links between hydrology and the needs of society. As a cross-cut programme of the UNESCO International Hydrological Programme, HELP is expected to contribute to the World Water Assessment Programme (WWAP), and the Hydrology and Water Resou Programme of WMO (HWRP).	
AWARE	Available Water Resource in the Mountain Environment an EU project involving Austria, Switzerland, Italy, Slovenia, and Spain, and 8 research labs and universities to establish a geo-service for tailoring models and data assimilation systems to improve forecasting and management of mountain water resources, including snowpack, floods, avalanches, and related water cycle hydrolologic processes.	
EFFS	European Flood Forecast System – a consortium of EU nations studying methods to improve flood predictions and warnings in central and southern Europe, part of the EU and NATO scientific community.	
UCOWR	The Universities Council on Water Resources (UCOWR) organization is comprised of about 90 universities in the United States and throughout the world. Member institutions engage in education, research, public service, international activities, and information support for policy development related to water resources. Each member university appoints four faculty members as UCOWR lead delegates. Others may join as individual members	
HON	Hydrological Observatory Network-an emerging network of hydrologic observations in Europe developed to monitor global change impacts on hydrology, flood frequency and intensity, hydrologic predictions within the EU fashioned after the US CUAHSI.	
ALPRESERV	Alpine reservoir sustainable management considering ecological and economical aspects within EU high alpine lakes and regions using ecological and hydrological decision-making tools and engineering management systems	
GIO	A NASA Level-II Program, Geosciences Interoperability Office (GI) that is responsible for agency-wide leadership of the development, promotion and implementation of geospatial interoperability through open standards.	
ESG	A NASA funded GIO project, the Earth-Sun System Gateway (ESG) is an interoperable prototype portal which enables the community to access, view, layer, and interact with dynamically updated results from NASA Earth-Sun System research, technology, education, and applied sciences programs.	
DAAC	Distributed Active Archive Center (DAAC) Located at NASA/GSFC they are one of eight NASA Science Mission Directorate (SMD) DAACs that offer Earth science data, information, and services to research scientists, applications scientists, applications users, and students. Their goal is to serve users Earth science data and information needs	
GLOBE	GLOBE (Global Learning and Observations to Benefit the Environment) is a worldwide hands-on, primary and secondary school-based education and science program. GLOBE is an interagency	

WaterNet is an extensive "solution network of networks and nodes", encompassing and interconnecting a large number of water-relevant existing networks, research results, and decision support tools. Here we summarize the statements of commitment we have received –this is only a small sample of the potential partners.

Org.	Name
NASA	NASA Energy & Water cycle Study (NEWS); NASA's Geosciences Interoperability Office (GIO); Earth-Sun System Gateway (ESG); Geospatial Applications & Interoperability (GAI); Global Learning and Observations to Benefit the Environment (GLOBE); EOS Clearing HOuse (ECHO); Distributed Active Archive Center (DAAC)
Academic	Consortium of Universities for the Advancement of Hydrologic Science (CUAHSI) 100+ members; Universities Council on Water Resources (UCOWR) 86 Universities in US & World; Collaborative Large-Scale Engineering Analysis Network for Environment Research (CLEANER); Long-Term Ecological Research (LTER); National Ecological Observatory Network (NEON) Sustainability of semi-Arid Hydrology and Riparian Areas (SAHRA); Hydrology Web

Earth-Sun Science System Components Knowledge Base

Catalogues standard NASA research products and specific partner decision support tools and makes it readily available to define potential collaborations. Includes an inventory of NASA affiliated Missions, Sensors, Data Products, Models, Model Products and partner Decision Support Systems.

Earth-Sun System Gateway

NASA's Earth-Sun System **Gateway (ESG) streamlines** access to remote geospatial data,imagery, models, and visualizations through open, standard Web protocols. By organizing detailed metadata about online resources into a flexible, searchable registry, it lets scientists, decisionmakers, and others access a wide variety of observations and predictions of natural and human phenomena related to Earth Science and the Earth-Sun System, from NASA and other sources.

Global Change Master Directory

GCMD enables users to locate and obtain access to Earth science data sets and services relevant to the global change and Earth science research. The GCMD database holds more than 16,000 descriptions of Earth science data sets and services covering all aspects of Earth and environmental sciences.

ESIP Federation

The Federation of Earth **Science Information Partners** brings together government agencies, universities, nonprofit organizations, and businesses in an effort to make Earth Science information available to a broader community. The objective of the Federation is to evolve methods that make Earth science data easy to preserve, locate, access and use for all beneficial applications

Achieving a Sustainable Planet

Federation Wide Search

17th Federation Meeting

The 2006 Summer Federation of Earth Science Information Partners ("Federation") Conference will run July 18-21, 2006 in Palisades, NY. The meeting will be held at the Lamont-Doherty Earth Observatory and will feature a mix of plenary, technical and science/applications breakout sessions. Registration for the meeting is \$250/members, \$325/non-members, if paid by June 1, 2008. (After June 1, the registration fee rises to \$325/members, \$400/non-members).

Click here for the 2006 summer meeting page.

About the Federation

The Federation of Earth Science Information Partners ("Federation") is a network of researchers and associated groups that collects, interprets and develops applications for satellite-generated Earth observation information. Founded in 1998 under a grant from NASA, the consortium includes more than 80 member organizations, spanning NASA and NOAA's data centers, government research laboratories, research universities, education resource providers, technology developers, and nonprofit and commercial enterprises.

The consortium's work is dedicated to providing the most up-to-date, science-based information to researchers and decision-makers who are working to understand and address the environmental, economic and social challenges facing our planet. By increasing the use and usability of this unique data and linking it with decision-making tools, the Federation contributes significantly to creating a healthy and sustainable world.

The Federation's network fosters collaboration and innovation. It brings together partners to develop models and tools that make Earth observation information more useful and accessible across many different communities. Together, Federation partners leverage the value of these important data resources for the betterment of society and our planet.

Partnership Applications

Six new applications for Federation Partnership have been submitted. Applications have been received from the following: Pacific Disaster Center, ESRI, the Global Change Master Directory (GCMD), ECHO and from Pacific Northwest National Laboratory/Battelle. In addition, there is one REASoN project application for A 0.05 degree global climate/interdisciplinary long term data set from AVHRR, MODIS

WaterNet: Benefits

WaterNet will establish the pathways and partnerships between water cycle research investments and various decision support needs, through the development of:

- an actionable database, including key research and decision tool metadata.
- innovative *communication strategies* (web forums, workshops, and information portals).
- improved user access to resources (metadata development & access, reformatting tools, etc.).
- improved water cycle *research community appreciation* for DST and model requirements (direct feedback to research projects on their application relevance, formal documentation, etc.).
- improved policymaker, *manager and stakeholder knowledge* of research products.
- socio-economic solution *pathway modeling* studies.
- finding and studying existing *success stories*.

Example solution improvements:

- improve the water supply forecasts for extreme events of drought and floods.
- science-based strategies for management and restoration of riparian ecosystems.
- information to develop institutional water banking/markets.

Potential WaterNet-WaterFund Partnerships:

- WaterFund *database contributions* (information of fund management or sector trends).
- use of knowledge mining tools to *identify significant unmet needs* of water user community.
- identify most promising research and development investments.
